

Corn Excellence Program

Ammonium nitrate, potassium nitrate, and ammonium sulfate, are all leading plant nutrition products for use on corn production to supplement the crops nutrient demands. We believe an application of these products will provide active nutrients to increase yield, improve nutrient uptake, stalk, and grain quality, as well as, enhance the benefits of fungicide applications.

\$2.00/acre rebate when you follow these two steps:

1. An application of Schertz Aerial Service, Inc. specialty fertilizer from growth stage V6 through V12.
2. Followed by a Schertz Aerial Service, Inc. application of eligible Strobil or Strobil Triazole pre-mixed fungicide from full tassel to brown silk.

Target areas for the Corn Excellence Program®

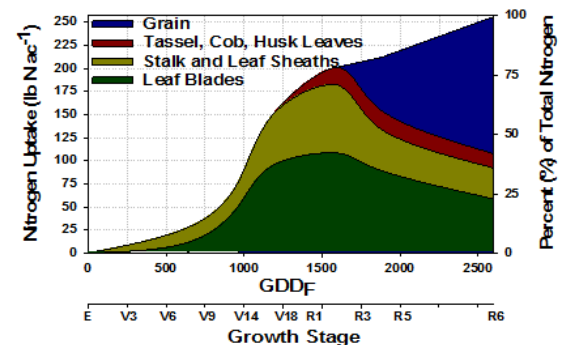

include: Nutrient stewardship and nutrient management plans, narrow row corn, continuous corn, high yield challenges, stress environments and the replacement of lost nutrients due to spring weather events.

Over the years there have been a deficiencies in nitrogen during a plants' times of need. Schertz Aerial Service, Inc. has chosen ammonium nitrate, potassium nitrate, and ammonium sulfate because it will be immediately available to the plant with minimal volatilization. We also acknowledge the difficulty in side-dressing 20" row corn and allowing fertilizer applications later in the season.

- No pruning to root mass
- No compaction issues
- No damage to field
- Increased yield potential
- Makes up for the N loss in cool, wet soils

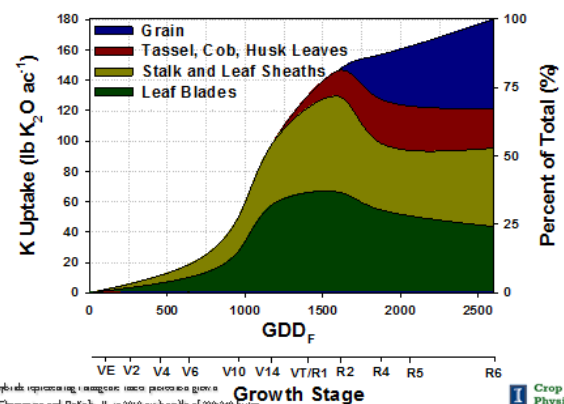

Full details of the Corn Excellence Program available upon request.

Seasonal Uptake & Partitioning of Nitrogen

6 hybrids representing all commercial bi-rotational hybrids grown in Champaign and DeKalb, IL in 2010 with yield so r220-240 bu/acre

Seasonal Potassium Uptake

6 hybrids representing all commercial bi-rotational hybrids grown in Champaign and DeKalb, IL in 2010 with yields of 220-240 bu/acre
