## Recommendations to Maximize Results in Corn

### Headline AMP™ Fungicide Rate

**Headline AMP @ 10 – 14.4 oz./A**
(field corn, seed corn, popcorn and sweet corn)

### Optimal Application Timing

**VT (100% tassel emergence) to R3 (milk stage)**

**Preventative applications maximize disease control, Plant Health and ROI.**

**Coverage:**
- Apply in 2 GPA or more by air.
- Apply in 20 GPA of water by ground.

### Remarks

- A non ionic surfactant is recommended for use with Headline AMP only after the corn reaches the VT stage (100% tassel emergence) or before the V8 corn growth stage to help ensure good spray coverage.
- **DO NOT** use adjuvants after the V8 stage and prior to the VT stage. Read and follow all directions regarding additive/adjuvant use on the label.
- **DO NOT** use adjuvants that contain methylated seed oil, crop oil concentrate or crop oil with emulsifier properties.
- **Adjuvant rates:**
  - The use of a non-ionic surfactant at the lowest labeled rate may be used to improve spray coverage.

### Adjuvant Usage
